The Basics The centerpiece of Photoshop is the Camera Raw Engine, which has its roots in Photoshop 3.0. The Camera Raw Engine extends the tonal range of the raw data files that are used to create images in Photoshop. Most cameras use JPEG format, which contains only 8-bit data. The Camera Raw Engine enables the user to see much more of the true color in the original raw data to correct contrast, exposure, focus, and color. The result is a more detailed image that can be printed on-press. Adobe has condensed the explanation of what Camera Raw is and how it works into one of its most basic definitions: "The Camera Raw Engine enables Photoshop to render images more accurately, which leads to better-looking prints." Photoshop has far more controls and tools to make creating a photo more manageable, but learning the basics and using the tools that fit the job at hand are essential to creating good images. The following are some of the basic tools. The Layer System Photoshop is all about layers and layers. The most visible layer that the user sees is the "active layer." The active layer shows through as the layer below it, while all the other layers are partially or completely hidden, and the bottom layer is completely hidden. To add a new layer, click on the new layer button in the Layers palette. In the Layers palette, you will see the additional layers. You can change the order of the layers, delete them, or hide them. When working in the Layers palette, it is best to stay on the active layer, add any other layers that you are working on, and then start to edit the active layer. Editing the layer allows you to move, rotate, and resize. The Move tool allows you to move layers independently of each other, and the Transform tool allows you to rotate, skew, warp, and scale the elements of a layer independently. If you need to copy a layer in the Layers palette, use the Copy button. To paste a layer, use the Paste button. The inverse of a layer is a hidden layer. To create a hidden layer, select the layer, and click the eye icon in the Layers palette to hide the layer. The Blend and Composite modes allow you to combine different layers to create different effects. Create effects using the various blend modes such as: • Normal • Multiply

Q: Javascript - Loop through and change src of an image So I have this HTML: The CSS: `.changelImage { display: block; cursor: pointer; float: right; text-align: center; } .myImage { height: 40px; width: 40px; }` And the jQuery: `$(".changelImage").click(function() { var el = this.parentNode; var imagelink = el.href; $('myImage').attr('src', imagelink); });` So right now when a user clicks on the `changelImage` class, I get the href of that li, get the src of the image and then change the src of the image to the href of the li. All this works, but I want it to be more dynamic. I want it to loop through all the images and change the src of each one to the src of the li that was clicked. This is what I want it to end up looking like in the end:
